

B. Amendment to the Abstract

Please amend the Abstract as follows:

In a luminescence device formed of one or plural layers of organic film between a cathode and an anode, at least one layer is a luminescence layer, and a luminescence molecule of a metal coordination compound having a basic structure represented by formula (1)  $\text{ML}_m\text{L}'_n$  ~~below~~ and having a substituent on at least one of cyclic groups ~~A and B~~ is incorporated as a guest in a host material at a concentration of at least 8 wt. %, which is higher than a concentration at which a luminescence molecule of a similar structure but having no substituent exhibits a maximum luminescence efficiency to form the luminescence layer. As a result, a high-efficiency luminescence device is provided, which is less likely ~~liable~~ to cause concentration extinction even when a luminescence molecule is contained at a high concentration relative to the host material in the luminescence layer.
